

# AdaptAlert™ Web Browser RF Activation Software

## AdaptAlert™ Web Browser RF Activation Software

AdaptAlert Web Activation from Warning Systems, Inc. (WSI) gives Emergency Management personnel a low cost system to activate radio frequency (RF) alert and warning devices (sirens, pagers, tone alert receivers) from any web-enabled device connected to the Internet; such as a desktop computer, laptop, Personal Digital Assistant (PDA), or mobile phone. The WSI AdaptAlert Web Activation Software is:

### ■ Simple

From a simple web browser screen, you can select whichever type message is needed to be sent to any selection of RF devices. The authorized user can select a custom-built, static, predefined message sequence and then select a single device or multiple groups of devices. You can also select prerecorded messages or type in custom text messages that are converted to audio (with the Text-to-Speech option). A prerecorded audio message can be uploaded as a wave file, which can be stored for use.

### ■ Affordable

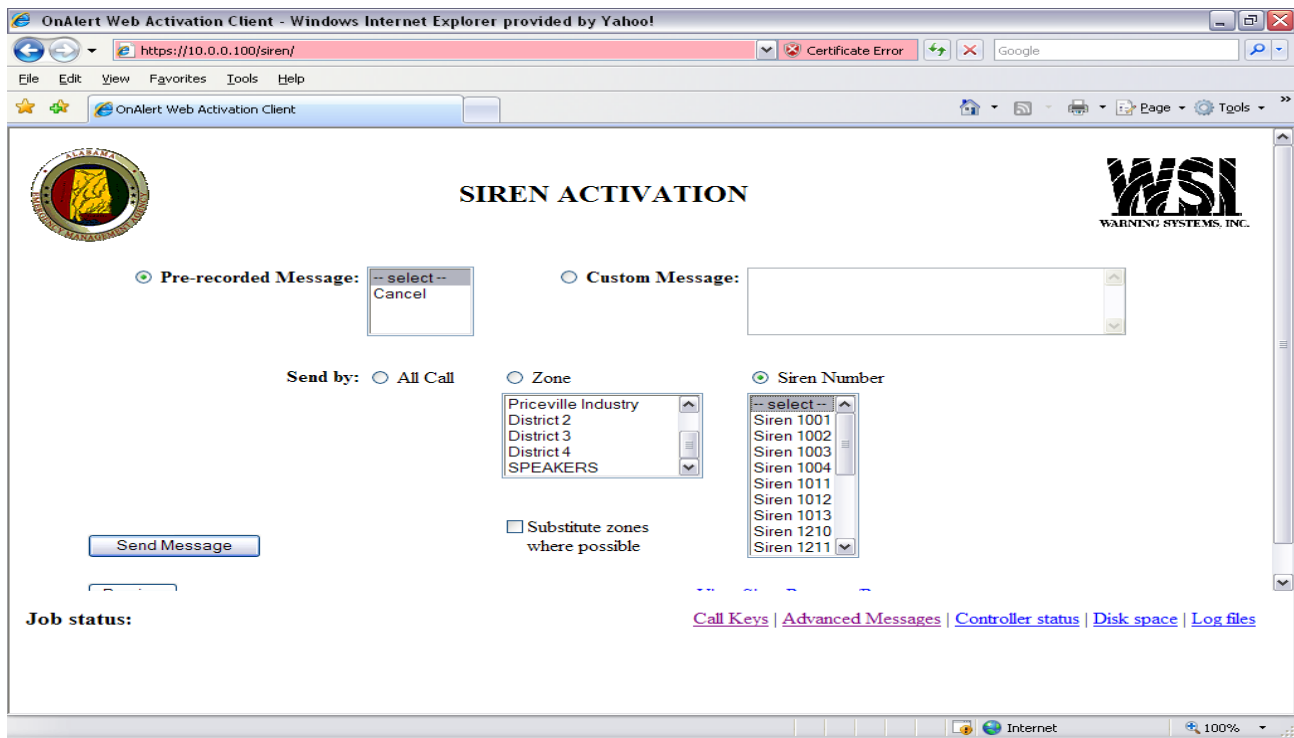

Why invest in expensive new computer systems if you don't have to? Why pay for multiple licenses for all of your authorized users? With AdaptAlert Web Browser Activation any number of authorized personnel can access the WSI RF Activation System through secure Internet logon. You no longer have to keep personnel in your emergency operations center 24 hours 7 days per week just to activate your RF alert and warning devices.

### ■ Secure

The AdaptAlert Web Browser Activation software is password protected and uses the highest available encryption (SSL 3.0). Web Browser RF software allows remote access to activate any selected RF device via a password protected 128 bit SSH encrypted and username/password authentication log in. Different levels of functionality can be restricted by user account, ensuring that only authorized personnel can send activation signals. All sent messages are maintained in a system log file for easy verification of past activations.

### ■ Versatile

AdaptAlert Web Browser Activation software can be accessed from a web browser connected to the internet, a local area network, or even through a direct connection if no network connection is available. In addition to the Web Browser Activation software that is standard on every AdaptAlert system, you can add options to activate from CAP messages sent over the Internet from other CAP-compliant software applications or use the WSI Map Client software package, which enables selection of activated devices by geography.

## AdaptAlert™ Web Browser RF Activation Features:

- Easy-to-use web interface for remote access over an Internet connection
- Comes as imbedded software on-board any WSI AdaptAlert RF Activation system
- Accessible with direct peer-to-peer connection as backup when network access is not available
- Multiple user accounts can be set with different privileges
- Username / password protected security - SSL 3.0 & 128 bit encryption
- Time-stamped message logging, with selected date reports
- System Log is archived for historical preservation
- Quick selection of custom-built, static, predefined message sequences
- Versatile selection of activation devices individually, by zone, or all
- Task Scheduler enables scheduling by month, day of the month, day of the week, hour, minute
- Dynamic Domain Name Service (DDNS) (IP Address assigned)
- Embedded Text-to-Speech (TTS) audio generation (optional)
- TTS audio preview, phonetic training and regional dialects capability (optional)
- Wireless network capable - WEP or WPA encryption (optional)
- Satellite feed (optional)
- Supports most web browsers (Internet Explorer 6.0 or higher, Firefox, Safari)
